2006 National Tall Fescue Cultivar Evaluation-2007 Data

Christopher J. Blume, Nick E. Christians, and Shui-zhang Fei

The tall fescue trial was established in the spring of 2007 and is part of the National Turfgrass Evaluation Program (NTEP). Similar trials are being conducted at many different locations around the U.S. The purpose of this trial is to evaluate adaptation and performance of 113 tall fescue cultivars under irrigated conditions with 2 lbs N /1000 ft² per year and a mowing height of 3 inches. A starter fertilizer with Siduron was used at establishment because the trial was established in the spring. Broadleaf herbicides were used as needed.

This is the 1st year of the trial. Cultivars were evaluated for turf quality each month during the growing season based on a scale of 9 to 1, with 1 being the worst quality and 9 being the best quality. The values listed in the table are averages of three replications. A grand mean of turf quality is listed in the last column. In addition to turf quality, data on percentage ground cover, in both spring and summer, and stem rust were collected (Table 1).

Table 1. 2007 ratings on turfgrass percentage ground cover, stem rust, and quality for the 2006 Tall Fescue Cultivar Trial in Ames, IA.
